Illustrated Checklist of Paleontology and Paleoanthropology related stamps

The **Check-List** of official, local and some personalized postage stamps and associated philatelic objects related to [Paleontology](#) and [Paleoanthropology](#) topics.

You can print it and make notes under the images, or use the [PDF version](#) of this page and make notes in PDF editor software. Example of the filled-out checklist is [here](#).

Please consider the environment before printing, this list which will occupy over 255 A4 pages, which might end up in the garbage bin at the end. Do you really have to print it, or a digital copy (PDF or other formats) is good enough? Let's try to protect our environment, save trees for the next generations and reduce garbage we produce.

Abbreviations

Mn: - MICHEL stamps catalog (Germany) number.

Sn: - Scott stamps catalog (USA) number.

N/L: - Not Listed in the catalog

N/A

- o N/A in the catalog numbers field - the catalog number is Not Available yet, but expected to be added later

- o N/A in other fields - Not Available, e.g. FDC: N/A - FDC for this issue is not available / wasn't produced

Set - stamps set or an individual stamp,

mnh - mint never hinged,

cto - cancelled to order,

usd - used (removed from a letter or postcard),

pf - perforated,

im - imperforate,

sa - self-adhesive,

gp - gutter pair,

op - over printed / surcharged,

FDC - First Day Cover,

c - clean,

m - mailed / gone through the post

FDS - First Day Sheet

Cov - Mailed envelope or postcard with the relevant stamp(s) on it

MC - Maxi Card

MS - Mini-Sheet

SS - Souvenir-Sheet

SH - Stamps-Sheet

PP - Presentation Pack

BK - Booklet

BP - Booklet Pane

PB - Prestige Booklet

CF - Collector Folder / Pack (usually limited edition)

The Status Legend

"-" Don't have - Looking for

"--" Don't have it, but not interested

"+" Have it

"++" Have it and have some spares for trade.

e.g. "++2" have 2 items for trade

"+/-" Have it, but would like to replace it or get another one (don't mix it up with "+" and "-" underneath - the link to the item marked by "+")

"**" Ordered/swapped it, but not received it yet

[Undesired stamps](#) marked by the gray background.

In mixed sets with both relevant and irrelevant stamps, stamps irrelevant to the topic are shown in "black and white" in the preview image.

For more details about the stamps in the checklist, please:

- Click on the image to enlarge it.
- Click on the year number to see all relevant [stamps of the year](#).
- Click on the country name under the preview image to be redirected to the [country page](#).
The country page contains a brief description of the county and its philatelic services, a list of all philatelic products related to the topic of the website, as well as some brief comments about them.
- If a description of the issue is available, the title of the issue will be a hyperlink to the description. Over 300 pages already exist and new [articles](#) are added [regularly](#).

Last time updated: 03.02.2024.

The History of Ichthyosaurs Discovery

Ichthyosaurs ("fish lizards") are an extinct group of aquatic marine reptiles (not fish nor lizards), who belong to the order known as Ichthyosauria. Ichthyosaurs lived on the Mesozoic era from the Early Triassic to the Late Cretaceous, about 250 million to 70 million years ago and were contemporaries of the Dinosaurs. However, they died out about 30 million years before the extinction of Dinosaurs. Ichthyosaurs are closely related to another aquatic group of reptiles the plesiosaurs. Both groups share some features of the skull (containing the upper temporal fenestra - openings in the skull behind the eye socket between the post-orbital and squamosal bones). They are derived from a supposed reptile ancestor and it more recent on the lineage successively lost the lower set of temporal fenestra.

Professor Dr. G. Henning was an expert of Palaeontology (1894-1965). In 1911, he discovered an old fossil animal in the shell near from the top.

The ichthyosaurs through convergent evolution evolved fish like body adapted for living in water exclusively. By the end of the Triassic, ichthyosaurs had adapted to fully aquatic conditions with streamlined bodies, fins, and a tail-shaped tail.

The fins and tail were used to propel the animals through the water when swimming. They were unable to return to land, and hence were unable to lay eggs on land like modern sea turtles do today.

Unlike most prehistoric and living reptiles, ichthyosaurs carried their live embryos inside their bodies until birth. The young were laid by side within their mother's womb with their heads pointing towards their mother's head. It would be reasonable to assume that the ichthyosaurs had developed some form of placenta for the care of their young. However, this hypothesis cannot be tested directly as the preservation of the fossils does not preserve enough detail.

Ichthyosaurs could, like some modern reptiles, have been ovo-viviparous, retaining the eggs in the body until they had fully developed. The embryos would then have fed from the yolk of each egg. Just as they would if the egg had been laid as a reptile's form "temporarily" as a fish.

Over 100 fossils of ichthyosaur mothers with embryos have been found to date. Some of these mothers had up to 11 babies!

A new study confirms that the first ichthyosaur ever has come out over the ground, quickly to avoid suffocation during birth. Over time, ichthyosaurs became more adapted to giving birth in water - at 180 younger, more advanced groups exhibiting new-born being born tail first, similar to modern dolphins and other cetaceans. It is thought that this adaptation developed to allow the new-born to more quickly swim to the water surface to breathe air.
